

# MARITIME OSINT AGENT v0.4

## Setup and Operator Guide

Local-first | Free by default | Small-team maritime incident monitoring

|               |                                                    |
|---------------|----------------------------------------------------|
| Version       | v0.4                                               |
| Default Mode  | Local-first, no paid APIs required                 |
| Default Login | admin / admin123                                   |
| Security Note | Change default password before any operational use |

## 1. Purpose

The Maritime OSINT Agent is a small-team maritime incident monitoring platform for collecting, classifying, reviewing and exporting open-source and user-submitted maritime incident information across the Indian Ocean Region and connected maritime approaches.

## 2. What v0.4 Adds

- In-app Help module for operators.
- Search bar, quick filters and improved dashboard workflow.
- Admin/Analyst controls to delete incidents and move them to another category.
- Incident comment system with edit/delete control for Admins and Analysts.
- Audit log for incident deletion, category movement and comment changes.
- Telegram group polling intake and manual social/link submission.

## 3. Installation on Windows

1. Install Python 3.11 or later.
2. Unzip the v0.4 software package.
3. Open Command Prompt or PowerShell inside the extracted folder.
4. Run the commands shown below.

```
python -m venv .venv
.venv\Scripts\activate
pip install -r requirements.txt
python scripts/init_db.py
uvicorn app.main:app --reload --host 127.0.0.1 --port 8000
```

Open the dashboard at: **http://127.0.0.1:8000**

## 4. LAN Sharing for Multiple Users

For small-team use on the same local network, run the LAN launcher. Other users should open the server IP address from their browser.

```
scripts\run_lan_windows.bat
```

Do not expose v0.4 directly to the public internet without HTTPS, firewall controls, stronger password management and deployment hardening.

## 5. Telegram Group Intake

Telegram intake allows multiple collectors to feed links and observations into the platform without dashboard access.

5. Create a bot using BotFather.
6. Add the bot to a Telegram group.
7. Keep bot privacy mode enabled for controlled intake.
8. Set TELEGRAM\_POLLING\_ENABLED=true and add TELEGRAM\_BOT\_TOKEN in .env.
9. Ask users to submit using /submit or /ingest only.

```
/submit Suspicious skiff approach reported off Somalia https://example.com/post
```

## 6. User Roles

| Role      | Permissions                                                  |
|-----------|--------------------------------------------------------------|
| Admin     | Manage users, sources, system controls and audit log.        |
| Analyst   | Review, edit, delete, reclassify, comment, export and brief. |
| Collector | Submit manual reports, social links and observations.        |
| Viewer    | View dashboard, incidents, sources and logs.                 |

## 7. Incident Handling Workflow

10. Review the incident card.
11. Verify source and location.
12. Move category if required.
13. Add or edit comments to preserve reasoning.
14. Delete false or irrelevant entries carefully.
15. Use Export CSV or Daily Brief after review.

## 8. Security and Operating Discipline

- Do not store X/Facebook/Instagram passwords in the software.
- Use Telegram/manual submission for social-media leads.
- Keep default admin credentials only for first test.
- Back up the data folder before major changes.

- Restrict LAN access to trusted networks.

## 9. Troubleshooting

| Issue                                | Action                                                                     |
|--------------------------------------|----------------------------------------------------------------------------|
| Dashboard does not open              | Check whether uvicorn is running and port 8000 is free.                    |
| Other users cannot connect on LAN    | Check firewall, server IP address and that LAN mode is using host 0.0.0.0. |
| Telegram items are not arriving      | Check bot token, polling flag, group permissions and /submit format.       |
| No incidents appear after collection | Check source logs and internet connectivity.                               |
